Use these programs as a starting point for discussions and experiments.

- Copy the code by hand.  
Learning to program is like learning to play the piano. We need lots of practice. We learn through our fingers.  
A teacher can be helpful. We can learn by watching and listening to an expert, but there is no substitute for putting our own hands on the keys.
- Leave out my comments if you wish.
- Add your own comments where that is helpful.
- Give the variables names that are more meaningful to you.
- Change the values of the variables. You may make the arrays bigger or smaller.

1. Here is an easy problem to get us started.

```

1 #include <stdio.h>
2 #include <stdlib.h>
3
4 int main( int argc , char** argv ) {
5
6     printf( "Which American president spoke Chinese?\n" );
7
8     // TO-DO: Add a statement here that prints the answer
9     // to the question.
10
11     // Hint: Search on the Internet. This president was
12     // born in West Branch, Iowa. That's less than 50 kilometers
13     // from Cornell College. There is a museum there that
14     // tells the story of this president's life.
15
16     // BONUS: This president's wife also spoke Chinese.
17     // The president and his wife sometimes spoke
18     // Chinese in the White House.
19
20     exit( 0 );
21 } // main( int , char** )

```

2. Do you think that this program produces the output that the programmer intended? Explain.

```

1 #include <stdio.h>
2 #include <stdlib.h>
3
4 int main( int argc , char** argv ) {
5
6     int a = 2;
7     int b = 3;
8
9     double average = (a + b)/2;
10
11     printf( "average of %2d and %2d = %8.4f\n" , a, b, average );
12
13     exit( 0 );
14 } // main( int , char** )

```

3. What is the output of this program?

```

1 #include <stdio.h>
2 #include <stdlib.h>
3
4 int main( int argc , char** argv ) {
5

```

```

6     int size = 5;
7     int data [] = {5, 2, 3, 1, 4};
8
9     int guess = data[0];
10    for( int i = 1; i < size; i++ ) {
11        if( data[i] < guess ) {
12            guess = data[i];
13        } // if
14    } // for
15
16    printf( "guess = %2d\n", guess );
17
18    exit( 0 );
19 } // main( int, char** )

```

4. What is the output of this program?

```

1  #include <stdio.h>
2  #include <stdlib.h>
3
4  int main( int argc, char** argv ) {
5
6      int size = 5;
7      int data [] = {5, 2, 3, 1, 4};
8
9      int guess = 0;
10     for( int i = 1; i < size; i++ ) {
11         if( data[i] < data[guess] ) {
12             guess = i;
13         } // if
14     } // for
15
16     printf( "data[%2d] = %2d\n", guess, data[guess] );
17
18     exit( 0 );
19 } // main( int, char** )

```

5. What is the output of this program?

```

1  #include <stdio.h>
2  #include <stdlib.h>
3
4  int main( int argc, char** argv ) {
5
6      int size = 8;
7      int samples [] = { 2, 3, 5, 11, 13, 17, 19, 7 };
8

```

```

9     for( int i = 0; i < size; i++ ) {
10         printf( "%4d", samples[i] );
11     } // for
12     printf( "\n" );
13
14     int i = 7;
15     while( i > 0 && samples[i] < samples[i - 1] ) {
16         int temp = samples[i];
17         samples[i] = samples[i - 1];
18         samples[i - 1] = temp;
19
20         i--;
21     } // while
22
23     for( int i = 0; i < size; i++ ) {
24         printf( "%4d", samples[i] );
25     } // for
26     printf( "\n" );
27
28     exit( 0 );
29 } // main( int, char** )

```

6. Create a working version of the program shown below on your own computer. Study the code.

- What is the decimal representation of the octal number 036?
- What is the hexadecimal representation of the octal number 036?

```

1 #include <stdio.h>
2 #include <stdlib.h>
3
4 int main( int argc, char** argv ) {
5
6     // a decimal representation of an integer
7     int a = 20;
8
9     // an octal representation of an integer
10    int b = 024;
11
12    // a hexadecimal representation of an integer
13    int c = 0x14;
14
15    // print values of the 3 variables
16    // as decimal ("d" for decimal) values,
17    // allowing 4 digits for each value
18    printf( "a = %4d\n", a );

```

```

19     printf( "b = %4d\n", b );
20     printf( "c = %4d\n", c );
21
22     printf( "\n\n" );
23
24     // print value of a in octal format
25     // ( "o" for octal)
26     printf( "a = %4o\n", a );
27
28     // print value of b in hexadecimal format
29     // ("x" for hexadecimal)
30     printf( "b = %4x\n", b );
31
32     // print value of c in decimal format
33     // ("d" for decimal)
34     printf( "c = %4d\n", c );
35
36     exit( 0 );
37 } // main( int, char** )

```

7. Create a working version of the program shown below on your own computer.

- Run the program. What do you see?
- $\wedge$  is one of the C programming language's bitwise operators. Which logical operation does it denote?
  - (a) Is it the **bitwise complement** operator?
  - (b) Is it the **bitwise and** operator?
  - (c) Is it the **bitwise or** operator?
  - (d) Is it the **bitwise xor** operator?
  - (e) Is it the **shift left** operator?
  - (f) Is it the **shift right** operator?
- 0xFFFFFFFF is an integer expressed in hexadecimal form. (The prefix "0x" tells the compiler that what follows is a hexadecimal integer.)
  - The hexadecimal number 0xF is one less than the hexadecimal number 0x10.
  - The hexadecimal number 0xFF is one less than the hexadecimal number 0x100.
  - The hexadecimal number 0xFFF is one less than the hexadecimal number 0x1000.
  - Examine this table. Do you see a pattern?

hexadecimal	decimal	hexadecimal	decimal
$10_{16}$	$16_{10} = 16^1$	$F_{16}$	$15_{10} = 16^1 - 1$
$100_{16}$	$256_{10} = 16^2$	$FF_{16}$	$255_{10} = 16^2 - 1$
$1000_{16}$	$4096_{10} = 16^3$	$FFF_{16}$	$4095_{10} = 16^3 - 1$
$\vdots$	$\vdots$	$\vdots$	$\vdots$

(a)  $0xFFFFFFFF$  is what power of 16 minus 1?

(b) Recall that  $16^x = 2^{4x}$ . For example,  $16^2 = 2^8$ .

$0xFFFFFFFF$  is what power of 2 minus 1?

- EXTRA CREDIT: Can you explain how this code produces these results?

Hint: Look online to learn how to compute the two's complement of a number. [Here](#) is an explanation from Cornell University. (I teach at Cornell College, a small school in Iowa. Cornell University is a different, much larger school in New York.)

```

1 #include <stdio.h>
2 #include <stdlib.h>
3
4 int main( int argc , char** argv ) {
5
6     for( int i = 0; i < 16; i++ ) {
7         int a = i;
8         int b = ( i ^ 0xFFFFFFFF ) + 1;
9
10        printf( "a = %d b = %d\n" , a , b );
11    } // for
12
13
14    exit( 0 );
15 } // main( int , char** )

```

8. Answer the questions that you find in the comments that begin with the words "TO-DO:".

```

1 #include <stdio.h>
2 #include <stdlib.h>
3
4 int main( int argc , char** argv ) {
5
6     // populations of Iowa and neighboring states
7     // TO-DO: What does 12.518e6 mean?
8     float illinois = 12.518e6;
9     float iowa = 3.174e6;
10    float minnesota = 5.740e6;
11    float missouri = 6.183e6;

```

```

12     float nebraska = 1.961e6;
13     float southDakota = 9.025e5;
14     float wisconsin = 5.868e6;
15
16     // array containing populations of 7 states
17     float populations[] = { illinois , iowa , minnesota ,
18         missouri , nebraska , southDakota , wisconsin };
19
20     // print populations
21     for( int i = 0; i < 7; i++ ) {
22         // TO-DO: What does "%12.0f" mean?
23         printf( "%12.0f\n", populations[i] );
24     } // for
25
26     // TO-DO: Write a loop that prints the populations
27     // of only those states whose population is greater
28     // than 5 million people.
29
30     // TO-DO: Write a loop that computes the sum
31     // of the populations of Iowa and the six
32     // states that surround Iowa.
33
34     // TO-DO: Suggest a data structure that could hold
35     // both the name and the population of each of the
36     // 7 states.
37
38     exit( 0 );
39 } // main( int , char** )

```
